— AGENTIC AI: FROM STRATEGY TO **PRODUCTION.**

Alexander Kastil

Full stack, from enterprise software to agentic AI. Since 1996

AI at Work
Value discovery, KPI mapping and roadmap

Enterprise AI
Governed multi-agent systems on Microsoft Copilot and Foundry

Agentic Software Engineering
Harness architecture for Claude Code and GitHub Copilot

Team Enablement
AI driven content production and delivery

MODULE 7

Publishing & Maintaining Copilot Studio Agents

Everything that happens after the agent works on your screen

Automate Business Processes with Copilot Studio and Copilot Cowork

01

Environments, Solutions & the Admin Center

Environment types, solutions and Dataverse

02

Publishing Agents & Microsoft Channels

Publish, authentication, Teams and SharePoint

03

Application Lifecycle Management & Source Control

Solutions, pipelines and Git

04

Using Advanced Channels: WhatsApp, Web & Direct Line

Optional: websites, Direct Line and WhatsApp

05

Agentic Building: Copilot Studio Plugins for Coding Agents

Build and migrate agents from the terminal

Publishing & Maintaining Copilot Studio Agents

Everything that happens after the agent works on your screen

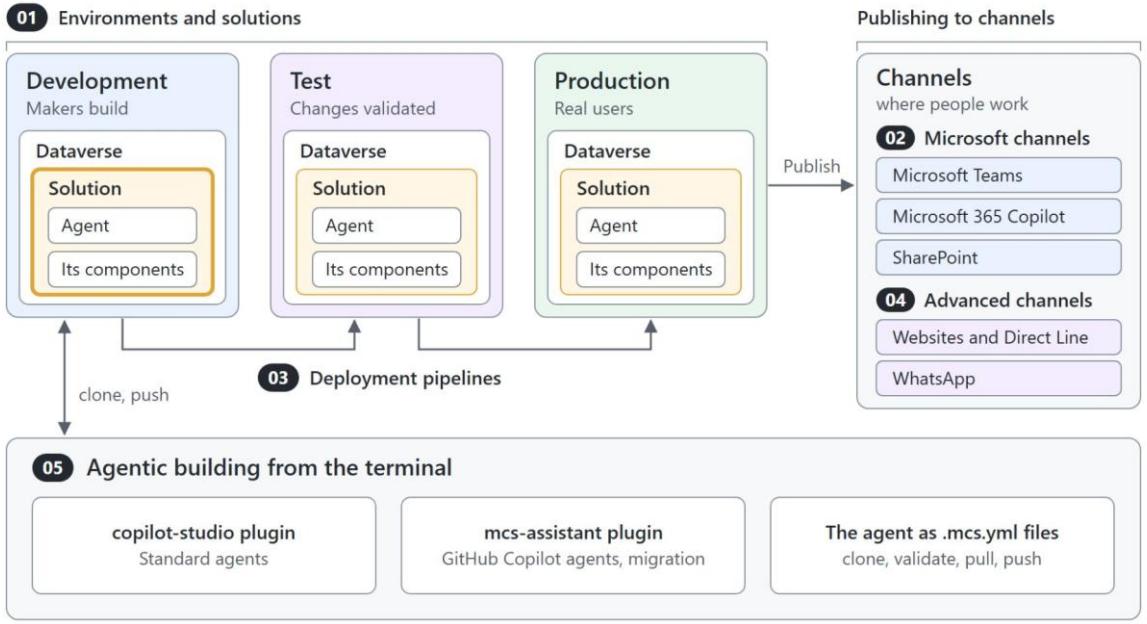

- **Publish** to the channels where people already work
- **Promote** from development to test to production with solutions
- **Build and migrate** agents from the terminal with coding agents

Overview

Five topics along the lifecycle of an agent

- **Environments and solutions**: development, test and production, with Dataverse holding the solution
- **Microsoft channels**: one publish reaches Teams, Microsoft 365 Copilot and SharePoint
- **ALM and source control**: deployment pipelines and Git move the solution forward
- **Advanced channels** (optional): websites, Direct Line and WhatsApp
- **Agentic building**: a coding agent clones and pushes the agent as files

01

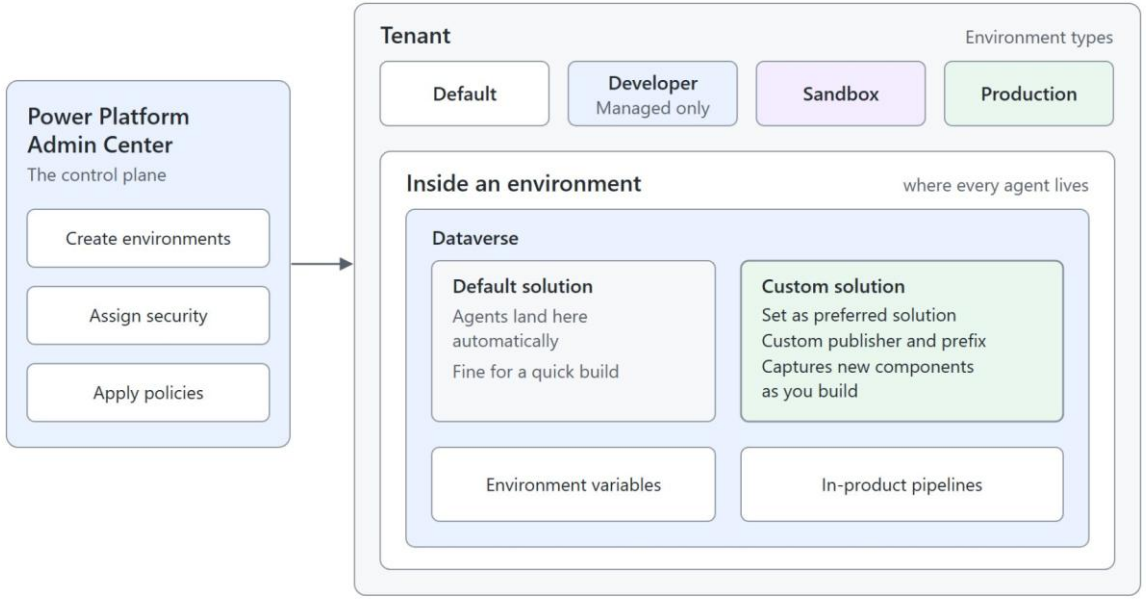

Environments, Solutions & the Admin Center

Environment types, solutions and Dataverse

Environments, solutions and Dataverse

Where every agent lives and how it is packaged

- **Power Platform Admin Center**: admins create environments, assign security and apply policies
- **Environment types**: default, developer, sandbox and production
- New agents land in the **default solution**; a **custom solution** set as preferred captures every component
- **Dataverse** stores solutions, environment variables and in-product pipelines

Unmanaged developer environments

Creation ends November 15, 2026; suspension follows on December 15

- Export your solutions or move to a **managed environment** before December 15, 2026

02

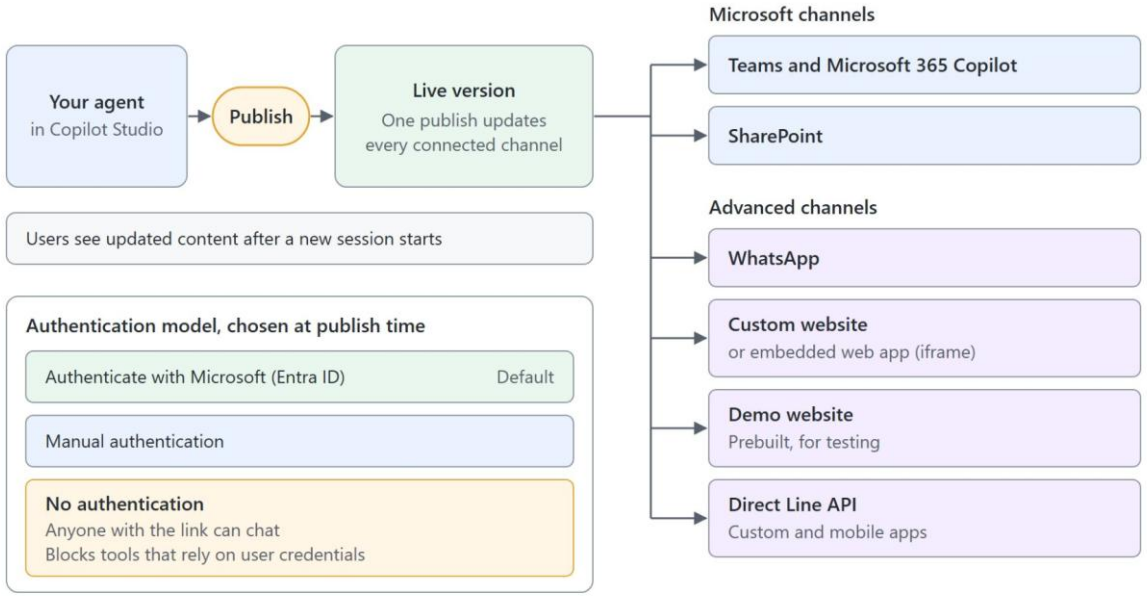

Publishing Agents & Microsoft Channels

Publish, authentication, Teams and SharePoint

Publishing and channels

One publish updates every connected channel

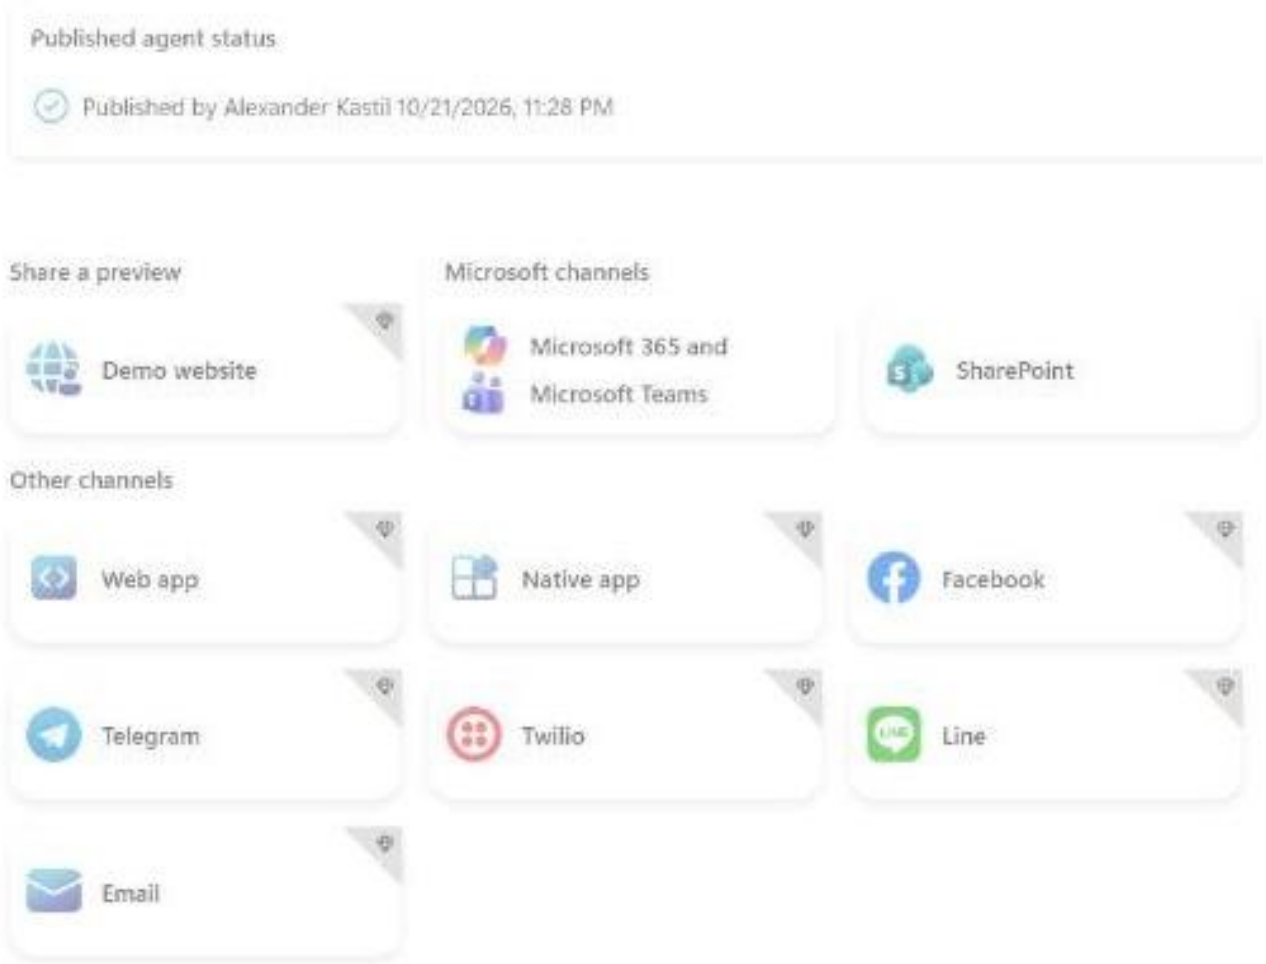

- **Publishing** creates the live version; nobody can use the agent before you publish
- One publish updates **every connected channel** at once
- **Microsoft channels**: Teams and Microsoft 365 Copilot, and SharePoint
- The **authentication model** is chosen at publish time: Entra ID by default, manual or none

Authentication and channel choice

The Channels page of a published agent

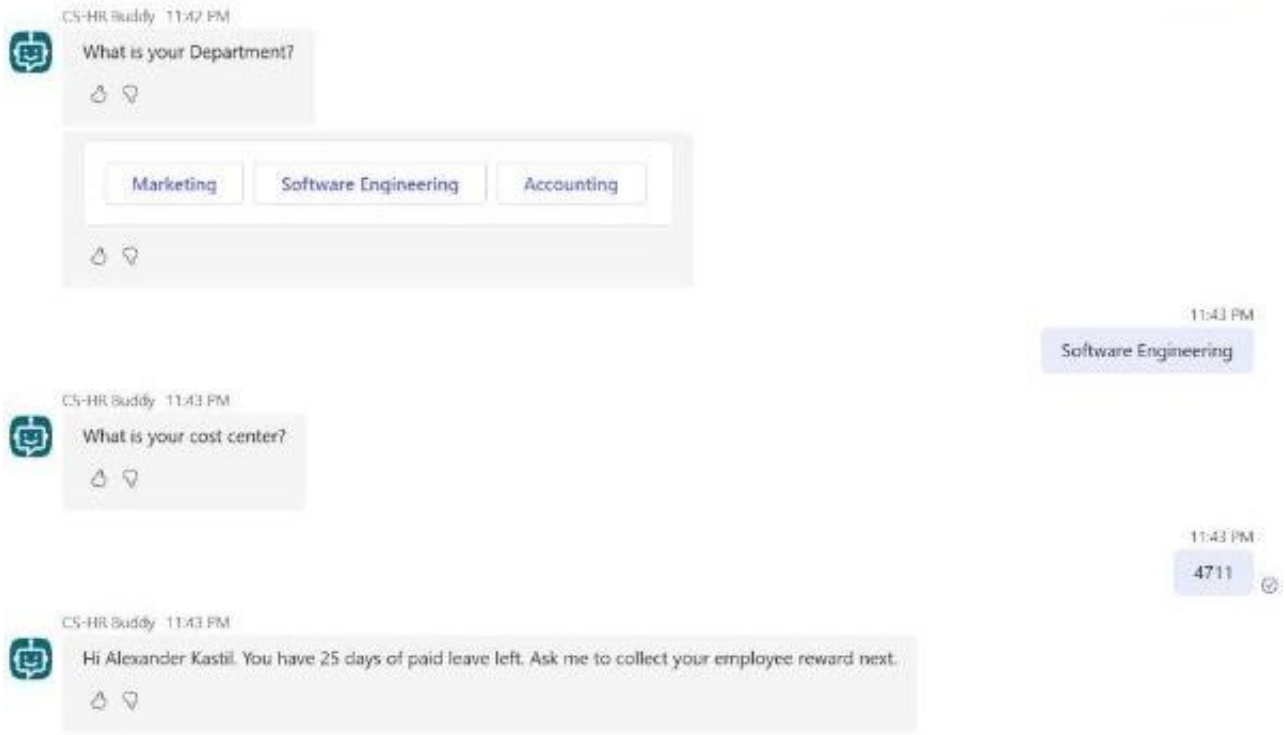

- **Published agent status** shows who published and when
- With **Microsoft authentication**, only Teams and Microsoft 365 and SharePoint are available
- Other channels need **manual** or **No authentication**
- No authentication lets anyone with the link chat and blocks tools that rely on **user credentials**

Republishing a change

One publish, then a new session in Teams

- Every change reaches users only through **Publish**
- A running conversation keeps the old version until a **new session** starts
- **start over** forces the new session in Teams
- The last answer ends with the **new sentence** from the republished topic

03

Application Lifecycle Management & Source Control

Solutions, pipelines and Git

ALM for Copilot Studio agents

Development, test and production, always in solutions

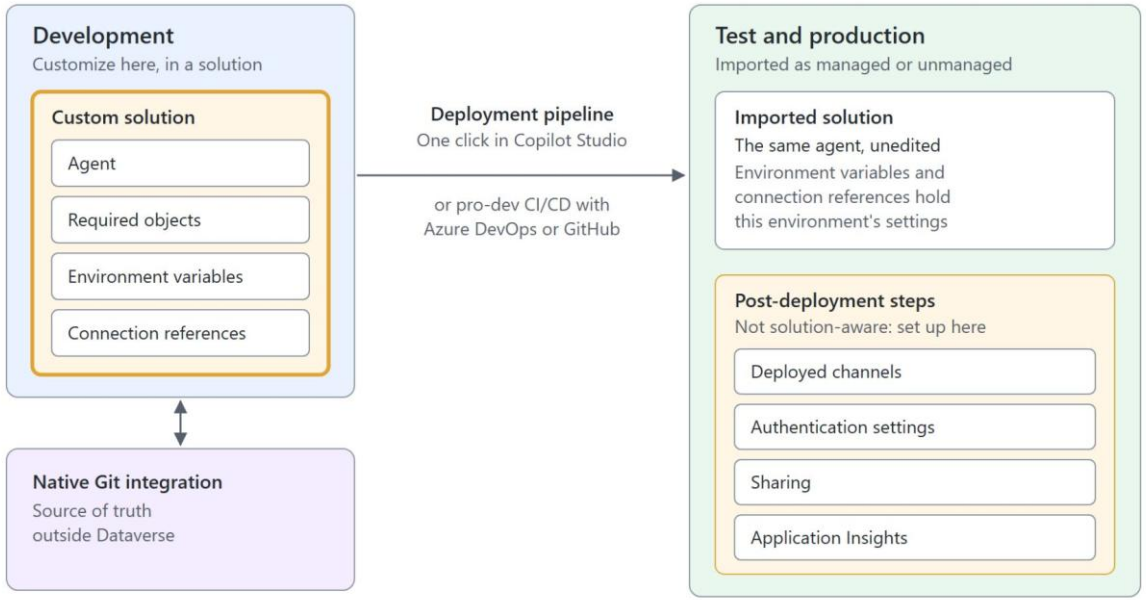

- **Three environments**: development, test and production
- Customize **only in development**
- Always work **in the context of solutions**
- Decide **managed or unmanaged** when you import
- Pipelines and source control make each release **automated and auditable**

What a solution carries

And what you set up after deployment

- A **custom solution** carries the agent and the objects it needs
- **Environment variables** and **connection references** hold the settings that change per environment
- **Deployment pipelines** promote in one click inside Copilot Studio; Azure DevOps or GitHub run pro-dev CI/CD
- **Native Git integration** keeps a source of truth outside Dataverse
- Deployed channels, authentication settings, sharing and Application Insights need **post-deployment steps**

04

Using Advanced Channels: WhatsApp, Web & Direct Line

Optional: websites, Direct Line and WhatsApp

Choosing an advanced channel

Reach beyond Microsoft 365, with its own sign-in limits

	Demo website Prebuilt, for testing	**Live website** Embed or Web Chat sample	**Mobile or custom app** Direct Line	**WhatsApp** QR code opens the chat
Use it for	Testing with teammates and stakeholders	A public help agent on your site	An agent inside your own app	Existing connections to customers on WhatsApp
Authentication	No authentication	No authentication for the embed code	Secret on the server, token in the client	No authentication or manual
Watch out for	Never share the URL with customers	Turn on secured access and use tokens	Needs developer work; refresh tokens	No new connections after October 23, 2026; card and file limits

Advanced channels are **Standard-agent** channels and trade Microsoft sign-in for reach

Web channel security and Direct Line

The secret stays on the server, the client gets a token

- **Require secured access** makes every client present a secret or a token
- The **secret** lives only in server code; browsers and apps get a **token**
- Two secrets work at once, so you **rotate without downtime**
- The app starts a conversation, posts messages and reads replies over **Direct Line**

The demo website

For testing with teammates, never for customers

Share the **demo website** with teammates to test each change, and keep its URL away from customers

05

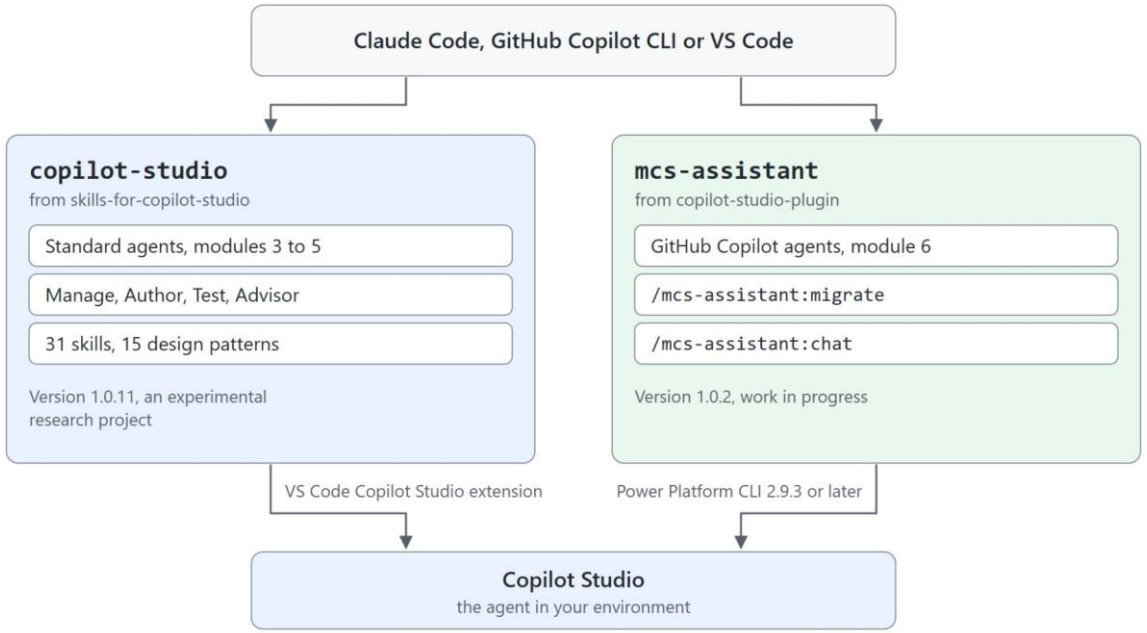

Agentic Building: Copilot Studio Plugins for Coding Agents

Build and migrate agents from the terminal

Copilot Studio plugins for coding agents

One plugin per agent type, one active at a time

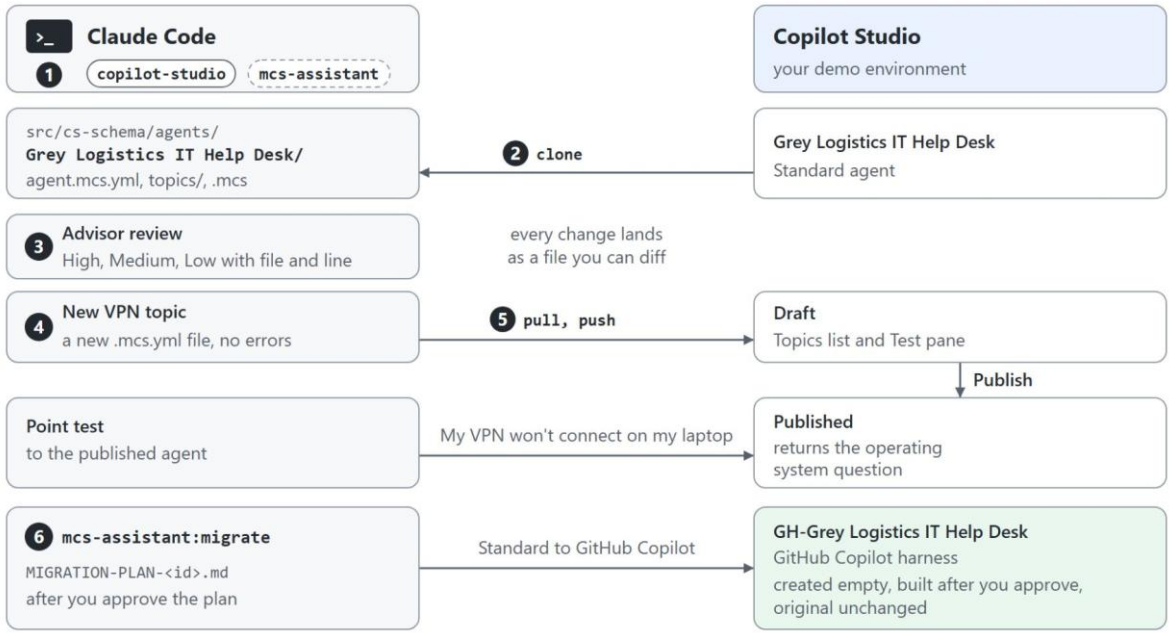

```
{
  "enabledPlugins": {
    "mcs-assistant@copilot-studio-plugin":
false
  }
}
```

Building and migrating from the terminal

The Grey Logistics IT Help Desk, cloned, extended, published and migrated

- **Clone first**: the plugin works only on an agent that already exists in an environment
- The **Advisor** ranks findings High, Medium and Low; the **Author** writes a validated VPN topic
- **Pull before you push**: the push lands as a draft for the Test pane
- **Publish**, then point test with "My VPN won't connect on my laptop"
- **/mcs-assistant:migrate** builds GH-Grey Logistics IT Help Desk; the original stays unchanged

Takeaways

From a personal sandbox to production

- Build in a **custom solution**, set as preferred, from the first component
- **Publish** once to every channel and choose the **authentication model** with care
- Promote with **pipelines and Git**, then finish the **post-deployment steps**
- Let a **coding agent** author, validate and push the agent as files
